Could the hotel business hold a future for a computer science major? Besides having to greet guests and fluff their pillows, the hotel business is built upon a framework of information related to many areas of study - mathematics, economics, and business. Fortunately, through the use of different technologies and methods, these areas of interest can be interwoven to form a single structure. The benefits of being able to manage all the aspects of running a hotel in one single application are astounding. It allows information to flow freely through managerial positions and allows for efficiency at all levels of employment. JProperty, a java based application was developed by Anup Tamakuwala (EconoLodge) to do just that. It allows a manager to keep track of guests, reservations, and to handle all employee information. The purpose of my internship was to add new high priority features to this application that would be the finishing touches to an already robust application.

Bekim is a senior in Computer Science. Besides majoring in Computer Science, Bekim has been very active on campus. He was a Student Ambassador and he was a member of the WPU Rugby Team. He did his internship in the summer of 2009.

All are welcome.
